

Amendments to the Claims:

This listing of claims will replace all prior versions, and listing, of claims in the application:

Listing of Claims:

Claims 1-24 (Cancelled)

25. (Currently Amended) A method for a soft handoff operation in a CDMA communication system, comprising:

transmitting data frames from a first base station to a mobile station in accordance with a first downlink data frame time offset, wherein said first downlink data frame time offset is measured from a channel frame timing associated with the first base station;

measuring a reception downlink time offset experienced at said mobile station between a first downlink transmission received from said first base station and a second downlink transmission from a second base station;

communicating said measured reception downlink time offset from said mobile station to at least one of said first and second base stations;

determining a second downlink data frame time offset based on said measured reception downlink time offset, wherein said second downlink data frame time offset is measured from a channel frame timing associated with the second base station, wherein said first and second downlink data frame time offsets are in increments of a predetermined number of chips;

communicating said second downlink data frame time offset to said mobile station for said soft handoff operation; and

transmitting data frames from said second base station to said mobile station in accordance with said second downlink data frame time offset, wherein data frames transmitted from said first and second base station carry the same data for said soft handoff operation..

26. (Previously Presented) The method as recited in claim 25 wherein said communicating said second downlink data frame time offset is by way of communicating an Active Set Update message in said CDMA communication system.

27. (Previously Presented) The method as recited in claim 25 wherein said communicating said measured reception downlink time offset is by way of communicating a measurement report message from said mobile station.

28. (Previously Presented) The method as recited in claim 25 further comprising:
adjusting timing of a time offset adjuster in said mobile station for adjusting data symbols timing according to said first and second downlink data frame time offsets for identifying corresponding data symbols in transmitted data frames from said first and second base stations for said soft handoff operation.

29. (Previously Presented) The method as recited in claim 28 wherein said soft handoff operation includes soft combining said corresponding data symbols.

30. (Currently Amended) A method for a soft handoff operation in a CDMA communication system, comprising:

measuring a reception downlink time offset experienced at a mobile station between a first downlink transmission received from a first base station and a second downlink transmission from a second base station;

communicating said measured reception downlink time offset from said mobile station to at least one of said first and second base stations;

receiving data frames from said first base station at said mobile station in accordance with a first downlink data frame time offset, wherein said first downlink data frame time offset is measured from a channel frame timing associated with the first base station;

receiving a second downlink data frame time offset at said mobile station for said soft handoff operation, wherein said second downlink data frame time offset is determined based on said measured reception downlink time offset, and wherein said second downlink data frame

time offset is measured from a channel frame timing associated with the second base station, and wherein said first and second downlink data frame time offsets are in increments of a predetermined number of chips; and

receiving data frames from said second base station at said mobile station in accordance with said second downlink data frame time offset, wherein data frames received from said first and second base stations carry the same data for said soft handoff operation.

31. (Previously Presented) The method as recited in claim 30 wherein said receiving said second downlink data frame time offset at said mobile station for said soft handoff operation is by way of receiving an Active Set Update message.

32. (Previously Presented) The method as recited in claim 30 wherein said communicating said measured reception time offset is by way of communicating a measurement report message from said mobile station.

33. (Previously Presented) The method as recited in claim 30 further comprising:
adjusting timing of a time offset adjuster in said mobile station for adjusting reception data symbols timing according to said first and second downlink data frame time offsets for identifying corresponding data symbols in received data frames from said first and second base stations for said soft combining operation.

34. (Previously Presented) The method as recited in claim 33 wherein said soft handoff operation includes soft combining said corresponding data symbols.

35. (Currently Amended) An apparatus for a soft handoff operation in a CDMA communication system, comprising:

a transmitter and a receiver, wherein said receiver includes a timing block, a de-spreader, a demodulator and a decoder, configured for performing a set of operations including:

measuring a reception downlink time offset experienced at said receiver between a first downlink transmission received from a first base station and a second downlink transmission from a second base station;

communicating said measured reception downlink time offset from said transmitter to at least one of said first and second base stations;

receiving data frames from said first base station at said receiver in accordance with a first downlink data frame time offset, wherein said first downlink data frame time offset is measured from a channel frame timing associated with the first base station;

receiving a second downlink data frame time offset at said receiver for said soft handoff operation, wherein said second downlink data frame time offset is determined based on said measured reception downlink time offset, and wherein said second downlink data frame time offset is measured from a channel frame timing associated with the second base station, and wherein said first and second downlink data frame time offsets are in increments of a predetermined number of chips; and

receiving data frames from said second base station at said mobile station in accordance with said second downlink data frame time offset, wherein data frames transmitted from said first and second base stations carry the same data for said soft handoff operation.

36. (Previously Presented) The apparatus as recited in claim 35, wherein said set of operations further comprising:

adjusting timing of a time offset adjuster in said mobile station for adjusting reception data symbols timing according to said first and second downlink data frame time offsets for identifying corresponding data symbols in received data frames from said first and second base stations for said soft combining operation.

37. (Previously Presented) The apparatus as recited in claim 36, wherein said set of operations further comprising:

soft combining said corresponding data symbols.

38. (Currently Amended) A method for a soft handoff operation in a CDMA communication system, comprising:

transmitting data frames from a first base station to a mobile station in accordance with a first downlink data frame time offset, wherein said first downlink data frame time offset is measured from a channel frame timing associated with the first base station;

receiving a measured reception downlink time offset from said mobile station at one of said first and second base stations, wherein said measured reception downlink time offset is the reception time offset experienced at said mobile station between a first downlink transmission from said first base station and a second downlink transmission from a second base station;

determining a second downlink time offset based on said measured reception downlink time offset, wherein said second downlink data frame time offset is measured from a channel frame timing associated with the second base station, wherein said first and second downlink data frame time offsets are in increments of a predetermined number of chips;

communicating said second downlink data frame time offset to said mobile station for said soft handoff operation; and

transmitting data frames from said second base station to said mobile station in accordance with said second downlink data frame time offset, wherein data frames transmitted from said first and second base station carry the same data for said soft handoff operation..

39. (Previously Presented) The method as recited in claim 38 wherein said communicating said second downlink data frame time offset is by way of communicating an Active Set Update message in said CDMA communication system.

40. (Previously Presented) The method as recited in claim 38 wherein said receiving said measured reception downlink time offset is by way of receiving a measurement report message from said mobile station.

41. (Currently Amended) An apparatus for a soft handoff operation in a CDMA communication system, comprising:

a transmitter, a receiver and associated control apparatus configured for performing a set of operations for said handoff operation, wherein said set of operations includes:

transmitting data frames from a first base station to a mobile station in accordance with a first downlink data frame time offset, wherein said first downlink data frame time offset is measured from a channel frame timing associated with the first base station;

receiving a measured reception downlink time offset from said mobile station at one of said first and second base stations, wherein said measured reception downlink time offset is the reception time offset experienced at said mobile station between a first downlink transmission from said first base station and a second downlink transmission from a second base station;

determining a second downlink time offset based on said measured reception downlink time offset, wherein said second downlink data frame time offset is measured from a channel frame timing associated with the second base station, wherein said first and second downlink data frame time offsets are in increments of a predetermined number of chips;

communicating said second downlink data frame time offset to said mobile station for said soft handoff operation; and

transmitting data frames from said second base station to said mobile station in accordance with said second downlink data frame time offset, wherein data frames transmitted from said first and second base station carry the same data for said soft handoff operation..

42. (Previously Presented) The apparatus as recited in claim 41 wherein said communicating said second downlink data frame time offset in said set of operations is by way of communicating an Active Set Update message in said CDMA communication system.

43. (Previously Presented) The method as recited in claim 41 wherein said receiving said measured reception downlink time offset in said set of operations is by way of receiving a measurement report message from said mobile station.
